SIGNALS

BOTTOM-LINE JUDGEMENT

Automated monitoring of 48 content items from 14 sources across news media, Telegram intelligence channels, official government sources, dark web forums, and social media reveals 5 narrative clusters and 23 intelligence signals related to online child exploitation in Kerala. Key findings: Predator networks targeting minors through gaming platforms and social media with documented migration patterns to private messaging; AI-generated synthetic exploitation content surging (35% increase per NCMEC); financial trails via UPI, cryptocurrency, and hawala networks traced and frozen; cross-platform identity correlation linking suspects across Telegram, Discord, dark web, and crypto wallets. Engine C identifier intelligence extracted phone numbers, Telegram handles, email addresses, UPI IDs, and crypto wallet addresses from unstructured content — automating cross-source correlation that would require manual search across hundreds of messages and multiple platforms. Collection period: 08 Jun 2026 to 04 Jul 2026.

PLATFORM POSITIONING: Anveshak handles the investigation intelligence layer — source monitoring, identifier correlation, network mapping, financial trails, and deepfake detection. It integrates with NCMEC/Interpol hash databases for content matching. The platform does not store or process actual CSAM — it maps the networks distributing it.

ROADMAP — EXTENSIONS FOR CHILD PROTECTION: (1) NCMEC/Interpol Hash Database Integration — PhotoDNA and ICSE database hash matching against known CSAM databases for automated content identification without human viewing. (2) Age Estimation Model — Facial age estimation to triage and flag content involving minors, reducing investigator exposure. (3) Audio/Video Transcription — Whisper-based speech-to-text for grooming conversations in voice messages and video calls. (4) Device Forensics Import — Parse Cellebrite/UFED exports from seized devices, browser history, and chat export ingestion for complete investigation support. (5) Victim Identification Support — Background and scene matching across images for location identification using YOLO object detection and CLIP visual similarity.

Sourcing, Limitations & Confidence

Data Acquisition

Automated open-source collection via Anveshak platform. Sources configured by analyst — web scraping (Crawl4AI), social media adapters (Telegram, Reddit, Bluesky, X), and RSS feeds.

Analysis Period

48 content items from 14 sources, processed through multilingual NLP (spaCy + NLLB-200), narrative clustering (Leiden algorithm), and entity extraction.

Confidence Calibration

Confidence level (82%) reflects the fraction of narrative clusters corroborated by 2+ independent sources. Individual source credibility scores are auto-adjusted based on deepfake detection, contradiction analysis, and analyst feedback.

Limitations

This report is a point-in-time snapshot. Source credibility scores may have changed since generation. All AI-generated summaries require analyst verification. Legal provision mappings (if present) are AI-generated and require verification by a qualified legal officer.
